FL ARTHROGRAM SHOULDER RIGHT

Collected on May 8, 2018 11:20 AM

Novant Health

Results

Impression

IMPRESSION:

1. No conventional arthrographic evidence of full thickness rotator cuff tear.
2. Please see the separately dictated post arthrogram MRI for additional findings.

Narrative

HISTORY: Pain.

COMPARISONS: X-rays dated 2/14/2018.

PROCEDURE: Informed consent was obtained. The patient was placed supine on the fluoroscopy table. The skin anterior to the right shoulder was marked and prepped and draped in the usual sterile fashion. Following adequate local anesthesia with 1% Xylocaine, a 22-gauge spinal needle was introduced into the glenohumeral joint. Permanent image was obtained with the needle in the joint. Following administration of Xylocaine, approximately 12-15 cc of dilute gadolinium (0.1 cc of gadolinium mixed with Xylocaine and contrast) was injected during intermittent fluoroscopic observation. The needle was removed and hemostasis was achieved. The patient tolerated the procedure well without apparent complication.

FLUORO TIME: 18 seconds.

NUMBER OF IMAGES: 4 fluoroscopic images.

INTERPRETATION: Contrast injected into the glenohumeral joint remains within the glenohumeral joint without evidence of extravasation to suggest full thickness rotator cuff tear.
